Thinking/reasoning/insight- Purple
Manipulation and deception- Blue
Adaptation- Scarlet
Self awareness, meta cognition- light blue

Context: a sick person from this family ran away under the pressure of an abusive father who hated this person. This person had problems with his mental health and nervous system, as well as with his brain, with some dead brain cells, which made him unable to perceive reality, as he had previously attempted to commit suicide by inhaling gas.
The woman returned from work at 6:00 p.m. She and her son (let's call him Lincoln) began searching for this person because he was a part of their family, but they were unable to find him.

Achievements: Lincoln assumed that the open door indicated that the abusive father had given up and gone to look for him himself, or that he had simply given up and gone to drink again. He then suggested that the second part of the search should be focused on going to the nearest liquor store, as the father's condition would further exacerbate the already dire situation.
(Analytical thinking, induction).
Lincoln determined from the untouched snow on the road that the sick person had not used it to escape, as it would have been illogical because the path was completely blocked and he did not see any way to sneak through undetected.
(Logical thinking).

Lincoln assumed that since the sick person had left 3-4 minutes before the mother's arrival, he could have passed her on the straight road in the middle, as she did not see him from behind when she entered the house, or he could have run away, but overall, he suggested that this was due to the darkness and the fact that the sick person could have taken a vertical straight path, as she could not have noticed him in the dark when she turned, especially since she had already passed by this path.
(VSI, logical thinking, illogical thinking, deduction).

He suggested that the sick person wanted to commit suicide because he had recently lost contact with a toxic friend who, in a world where he was considered completely retarded, unnecessary, and worthless, at least provided the appearance of friendship, even if he was an abuser in that friendship. The patient was holding on to him, but after losing that connection, he just couldn't adapt to the society around him without someone to support him, even if it meant causing him pain.
(Psychology, theory of mind, EU, EP, empathy).

The main part of his feats begins here: when the police arrived, and he was completely exhausted and hadn't prepared a scenario for this event (which is essentially an anti-feat due to fatigue), he was immediately summoned for a night interrogation. He hadn't prepared, but he instantly came up with a lie to protect his family from being deprived of their parental rights. He claimed that the patient had started sniffing gas in another location (a sauna right in their backyard), which they barely visited, and they might not have been aware of what was happening there. This partially absolved them of responsibility, as they might not have known. Additionally, he said that it happened the day before he told the entire family that the patient was sniffing gas, as he was confused. He found him lying on the sauna floor in a semi-conscious state, with a canister that had fallen from his hands, and he was able to pull him out of the sauna, hiding the spray can so that he wouldn't touch it again.
In case there were any traces in the sauna, he would claim that they had bathed there. If no evidence or traces were found, it would mean that they didn't exist, as it was a lie, but the fact that he had once told the entire family the truth was true.
Lincoln also controlled his image when he realized how to turn his initial lie to his advantage. He began to combine discomfort and increasing tension with conscious calmness and responded to the questions in the appropriate manner.
(FRI, logical thinking, anticipation, deception, acting skills, stress resistance, AC, impulse control, empathy, attention redirection strategy)

Lincoln prepared an alibi in case his testimony seemed too calm, and he claimed that he had relaxed specifically during the conversation with the specific police officers during the interrogation, which was indeed calm, which was partially true.
(Empathy, self-awareness).

He deleted the chat with ChatGpt, in which he discussed the possible difficulties and risks in this situation, as well as what needs to be taken into account (but his ideas for solving problems were original). He deleted the chat in case his phone was asked to be shown, although this was paranoia.
(risk assessment)

When, at the same hour, he received a call from bullies from school who had previously bullied the patient and his family and terrorized them financially, one of them said that he wanted to help with the search, but began by asking where the patient might have gone. He first asked where the bullies had heard about the incident, and the patient replied that he had heard about it from a teacher who was at the police station, while the teacher in charge of the patient was absent.

Lincoln did not believe the bully and immediately recognized the voice, which he had not heard for about two years. During the second call, he realized the caller's possible ill intentions and referred the matter to the rescue team, providing basic information that was unlikely to be helpful and stating that he was confused himself, as well as knowing that the patient had a history of conflicts with them.
(Pattern recognition, connecting the dots, induction, disorientation, anticipation, intuition, problem-solving abilities).

Lincoln agreed with his mother that if this continued, she would testify in accordance with his testimony, which did not contradict each other
(Long term strategy, strategy length, risk calculation, problem-solving).

And moreover, he did not stop there, because when the situation ended in 1 hour, he posted this story as an object of pride specifically on a site where he could be "approved" and at the very "bottom" of the Internet, where even the creator was a bad person, the police would hardly have entered the site and I would hardly have been sitting in this "garbage", and I would hardly have noticed his post in the spam stream, but the main thing is that he did not mention synchronization with his mother in the text, because if the police had somehow found out anyway, he could have used synchronization as a "trump card".
Then he came up with the idea that if the patient somehow came to himself for a while and said that everything wasn't like that, he would say that it was because he pulled the patient out when he was "high", and they didn't remember much when they were high, and the next day he pulled him out of the room right knowing because that's why he remembers, because he wasn't "high," he also realized that his grandfather and father could ruin the testimony if the case was investigated further, so he would say that he told his only mother about it because he trusted her the most and despaired, but he confessed to the family.
(long term strategy, planning complexity, foresight, risk management, risk calculation, deception, strategy length, strategy success rate).

From the very beginning, Lincoln knew that if he fell asleep, there was a chance that the interrogation would last for hours in parallel, and when his father returned, then the testimony would differ, which meant that he should not sleep and should twist the situation all night.
(Long term planning, long term strategy, risk calculation, risk management).

he had a bunch of intellectual stories that he could use as proof that what he wrote on the "bottom" of the Internet, if it was found, was his embellished version, which he embellished and wrote into intellectual stories, although there were supposedly no intellectual passages.
(Long term planning, anticipation, risk management, problem solving).

He knew that his plan was essentially invulnerable because the truth could not be proven even if arguments against it were presented, because they could not be verified due to his layers of lies, only to force him to surrender.
(Meta cognition, planning invincible).

(A large part of his measures and strategies were unnecessary because the investigators were incompetent, but he accomplished most of them in an hour, and also used the AI during breaks to assess risks. The last part of his plan and strategy was simply a distraction for his intellect and a bit of a paranoid streak, even though he didn't know for sure whether the case had been closed and simply didn't remember.)

His other feats: **In the Mafia game, there were two mafia games in a class with 14 students, and he won the first one as an ordinary person in his role, but even before the first game began, he came up with a tactic for the Mafia and essentially any other significant role: put one hand (left) on the desk during the time is “mafia is sleeping” and “peaceful are falling asleep”, the right hand should be free, it worked because if he did not do this, it could create unnecessary noise if he is “mafia", and you can tell by the sound. He used the index finger of his right hand. His classmate was sitting directly to the left because the desk was for two, and he did this so that no one in the next game would suspect him of being a tactic and get used to his pose.**
And so, in the second game, he became a mafia, because of severe selective mutism and isolation, he could not speak, however, he used “geolocation strategy” to create a clear pattern of murders, mostly the rightmost row, so that some might think that the right row was killing itself in order to divert suspicion. and he also didn't touch the middle row when he was a mafia, he killed one of his row to minimize the risk, raised his hand against his mafia classmate when it was almost obvious that it was her, to deflect suspicion from himself because the mafia usually doesn't vote for the mafia.
When he was completely confused about who was alive and who was not, when the losers could accuse him, intercede, and the hosts also did not remember who was killed and who was not, he was confused, and did not know exactly who was alive and who was not, but he knew that at least 5 others were alive when he accused one classmate and up to a classmate- his friend, he was indirectly protected by his roommate, who accused another classmate, immediately after that, at night, he killed his roommate to create a pattern of the mafia killing suspects, and also because the same pattern could work for him if he killed a classmate, but it was a strategic a mistake.
He lost because one of the high school students who did not participate said that “the mafia is always quiet,” which raised even more suspicions about him, and the Mafia classmate tried to hint that it was him.
The second game lasted only 14-15 minutes, but about 9-10 people dropped out, and he was in a TERRIBLE state where he felt weak, feverish, in pain, as well as a sore head, and he probably had a fever, which worsened his performance and ability to think clearly.
Hours later, he realized that the classmate most likely did not tell her friends sitting in their row right at the same bottom of the row, but she could hint through too long glances at him or facial expressions, which Lincoln eventually understood, although he did not turn around and did not hear what was behind
(strategy of creativity, strategic castling, tactics, abduction).

After watching the episodes of the third season of "Squid Games," Lincoln came to the conclusion that the best thing for the blue team would be to hide in the middle of the second floor of the supposedly three floors. An average room would ensure that

there would be fewer chances of a surprise attack from any corner. And the reds, starting from different entrances to the second floor (the entrances are located at the ends of the floor), would have to walk the same distance if the maze is uniform. Plus, the red and blue ones start from different ends on the ground floor. The Reds will most likely go to the first floor first, because this is the beginning, or to the third floor because of the "sheep running away from wolves" mindset. It would be best to stay in a small group: too large a group would make noise. Others would take turns holding the door until the end of the game (VSI, mathematical thinking, theory of mind, strategy).

To understand how a revolver works, Lincoln had to visualize the drums. He came to the conclusion that it should be vertical if there are six reels, and he was right.
He visualized the next 200 meters in his head (VSI).

As a child, Lincoln seemed to "watch" episodes of any of his animated series in his head after several views — in an accelerated form, but there were practically no missing details in his head. He remembered a chess rule that he had looked at for about 10 seconds 5 months ago, and in a losing position with heavy losses, he used it to draw. He can remember the events of the films "Scream 6" and "Black Christmas" (2006) in 80-90% of the details in one viewing, after more than a year and almost two years (WMI, PSI, FRI).

At 6 months old, Lincoln uttered the word "ma-ma", and at the age of 2-3 he could already argue with his parents and relatives. At the age of 7, he was reading about 90 words per minute on a timer. Knows two languages (VCI).

He visualized 20 cards in Liar's Bar and mixing them to be dealt after a few games. Lincoln could figure out who had which cards only by visualizing during the game and judging by how others played (CPI, VSI, perception, observation).

In a situation where his older brother stole his phone, texted the homeroom teacher and the class group chat with insults and threats, in 1 hour Lincoln managed — in case the school psychologists came — to tell his mother to send money to his father at work for groceries, so that he would return later, after the rest of the conversation with psychologists, and I didn't find out because it's important. He predicted that rumors and information would spread throughout the school very quickly, and if the teacher didn't tell him instead that it wasn't him, it would be bad. His phone turned out to be with the school psychologist. He predicted that the headmistress, who likes to talk about everything on school lines, might tell or hint at this story. Lincoln calculated the time by changing colors at the traffic light next to the school in order to arrive later, before the start of the first lesson, to get ready, but at the same time to be on time — the colors of the traffic light changed at a precise time, and he did not have a watch or phone (FRI, adversity capability, prediction, anticipation, short term strategy).

Lincoln considers his recent trip to school at 2 p.m. to be one of his main achievements at FSIQ. When he went to school, he was simultaneously thinking about the meaning of the leaflets with the numbers "19" and "21" on the wooden poles of

overhead lines. Since "19" and "21" were on poles close to each other, he came to the conclusion that they had been numbered in this way earlier in the village, and this was in 2012, because one of them had "2012" written on it. Most likely, there were more than a hundred of them per village — he briefly visualized the location of the street and the bill, and where the bill could begin, and confirmed this to himself by the fact that there simply was no such thing on later metal supports, while on others the leaflets might have been removed or replaced.

Then Lincoln remembered where he was on the way when he realized all this, counted the time for reflection, his walking, the current time according to the mentions of classmates at recess — and in about 8 minutes he came to the conclusion where exactly he had an epiphany. He visualized the rest of the way after stopping, realized which way was shorter (although there were several turns and the gap was about 50 meters), calculated his walking speed and arrival time. He visualized the entire journey of about 742 meters with several turns and a segment to understand how quickly he came to a conclusion (CPI, VSI, abduction, logical reasoning, WMI).

On the show about fat people, where overweight participants (daughters) and their mothers undergo physical and psychological tests to lose the maximum number of kilograms, establish relationships and change their lifestyle, there was a test in the game "spy".
One team of purple, blue, yellow, and orange were the spies of the hosts, and the rest had to guess the team of spies. The spies substituted +1 kg after each mini-game for any team, which meant minus progress.
At the beginning, it was said that in the mini-games during the main spy game, the spies cannot score the highest number of points to win. Throughout the series, it was pointed out that the spies were yellow, and that was the difficulty.
But Lincoln determined that the spies were blue, because he noticed that blue was the first to seize the initiative and ask "which of us is the best actor?" — a standard leadership strategy to deflect suspicion. The blues got +1 kg twice in a row, which is illogical on the part of the yellows.
He didn't buy the fact that blue was literally crying in front of the camera: her cheeks were red, she was choking on tears. At the end of the episode, Lincoln instantly predicted that she, as the winner of this game, would give "+2" to herself or to no one, either out of guilt or out of the intention to preserve her good image (EU, perception, observation, prediction, anticipation, deduction, logical).
