Doomsday rex analyses

@Erikagoat

Analyses:-
Doomsday rex is a genetic aberration and an invincible predatory dinosaur which was designed as an organism that evolves and adapts time by time.

Doomsday rex had 2 stages of growth the first and initial form of doomsday rex was a 3-headed ouroboros like serpent with tentacles coming out of It's body

However,in its second form the creature looks more like a large theropod with now having 2 heads,extra 2 arms and spikes over the body which was resemble as doomsday

rex.

Well despite its kaiju like size the more important thing is what was this hybride made of and what are the cognitive abilities that could showcase this beast having hyper-intelligence.

The Doomsday rex's conceptual art atleast does confirms that the base genome is used inside of it is a t rex so we can use the modern studies based on them to measure this beast's intelligence.

How smart is the doomsday rex-
Categories-varies

Intelligence analyses:-

In some of today's studies it suggests that trex used to be the best land predator when it comes to utilizing their senses which is why they can actually sense their prey from very distance likely 3 and half miles away which does allow the sensory to observe the

surrounding and environment as well
In this case we can conclude that the Doomsday rex would be having exceptional senses to understand the environment.
(Observation,Perception,Social awareness)

This sensory ability would also give any t rex to process data and and then create a image of object or being whenever the study suggest that t rex senses can help the recognise the exact scent of the prey and then create an exact 3 dimensional model inside their brain which they recognise very well.
(Perception,VSI,Analyses,Pattern recognition)

T.rex and even including modern day predators use their ability to process other predators actions and attacks to withstand against in animal kingdom animals usually use their processing speed to react their attacks and counter them and like today's animals T.rex was no exception either they also use their ability process attacks and counter them by finding weaknesses or either overcoming their strengths and utilize critical thinking and decision making to make a formulate conclusion within the battle.
(PSI,Decision making,Countering,Critical thinking)

As we know of a factor about the Doomsday rex that it can evolve and adapt like it did previously to initial form to the 2nd form and did adapt itself to it
Which also make it belief that the Doomsday rex could be adaptive to difficulties like it is with it’s own evolution of itself.
(FRI,Adaptability)

Next thing what we should talk about this thing is if he is manipulative or not
Now be clear that manipulation exists in two ways:behavioral and intentional.

There are basically unconscious methods to manipulate someone in simple words,manipulating someone without having an intention of manipulation.

However,predator's like rex's were highly manipulative in this position even if ignoring the part of studied and specially talking about Doomsday rex itself was a kaiju like theropod with large spike that would already be inducing fear in any prey or human it confronts with no matter what that thing is they will also saw terror in front of them.
(Emotional manipulation,behavioral manipulation)

Coming back to the study analyses,a t.rex was a predator that could sneak out and hunt down prey like, suppose hiding behind a concealed area where prey cannot see them and then later on ambushing them from behind without them being able to read the next move.
(Concealment,Unpredictability,Logical manipulation)

Predator's like t.rex as predator could execute brilliant strategic points while while taking down a prey always looking for the weak spot and tracking down the strong points like with taking down a trike by exhibiting the weak points and breaking down the strong points they oftenly even use different methods such a previously explained ambush tactics to lock down prey and them executing such strategy in a harsh environment is already complex in itself.
(Strategy,Tactics,Methods)

One more thing to be precise here t.rex was a very smart dinosaur and was comparable to many reptilians such as the crocodile and other similar species who have shown the ability to set trap and planning

Which is often seen in animals such as making plans through complex social bonding specially during the mating season and then making up a plan to track down prey and even taking out an entire territory for their own group of family or even in a form of manipulating the enemy.
(Planning,Social skills)

Coming to a crucial part here about the Doomsday rex now

We have studied about animals fighting for territory and making their own self as a king in one place just like t.rex also does the same thing in their time which in fight cases they have to fight even after when they lost their arms or any other orgasm parts and still continue fighting to create their dominance and even managing themselves during the fight until one drawbacks there are cases of many ones losing their arm and tail or any other important part and still continue to perserve themself to fight over specially when a mother t.rex defending her children.
(Emotional management,emotional engagement,Overall AC)

Anyways if you have read this till end then tnx for reading it to be clear i work on them all alone so i cannot get time to complete them❤️
